

Consumer Credit Health Scorecard — Key Findings

Data: 16.9M CFPB complaints + Federal Reserve delinquency data | 2011–2026

Which states need attention right now

Texas and Florida are the most statistically abnormal states, nearly 4 standard deviations above the national average in complaint volume and still growing every month.

Georgia looks average by raw count but has the highest complaint rate per person in the country at 9,455 per 100,000 residents. Standard dashboards would miss this entirely.

Mississippi is the sleeper risk. Low total complaints historically but growing at 46% over the last 3 months. The states to watch are not always the loudest ones today.

What caused the January 2025 spike

Complaints jumped 231% year over year in January 2025. This was not a credit crisis. It was caused by a CFPB regulatory action against Navy Federal Credit Union. Delinquency rates actually went down during this period confirming the spike was not driven by consumer financial stress.

The product with the biggest gap between complaints and resolution

Debt collection generates the second highest complaint volume but only 0.2% of complaints result in any money back to the consumer. Credit card complaints result in monetary relief 13% of the time.

Recommendation

Prioritize TX, FL, MS, and AL for tighter underwriting review. Watch Mississippi specifically. It is accelerating faster than any other state and would be invisible on a standard volume dashboard.
